Global Steel at a Crossroads

*Why the global steel sector has to invest in
climate-neutral technologies in the 2020s*

Jesse Scott, Agora Energiewende
GLASGOW, 3 NOVEMBER 2021

Global steel is at a crossroads: By 2030, 71% of coal-based blast furnaces will reach the end of their operating life. New coal-based capacities are being built in emerging economies

Agora Industry based on World Steel Dynamics, 2021; Agora Industry, Wuppertal Institute & Lund University for China, 2021

Agora Industry based on World Steel Dynamics, 2021, TERI 2020 and SEASI 2020

Due to the long lifetimes of steelmaking assets, the investment decisions in the 2020s will be crucial for the global steel transformation

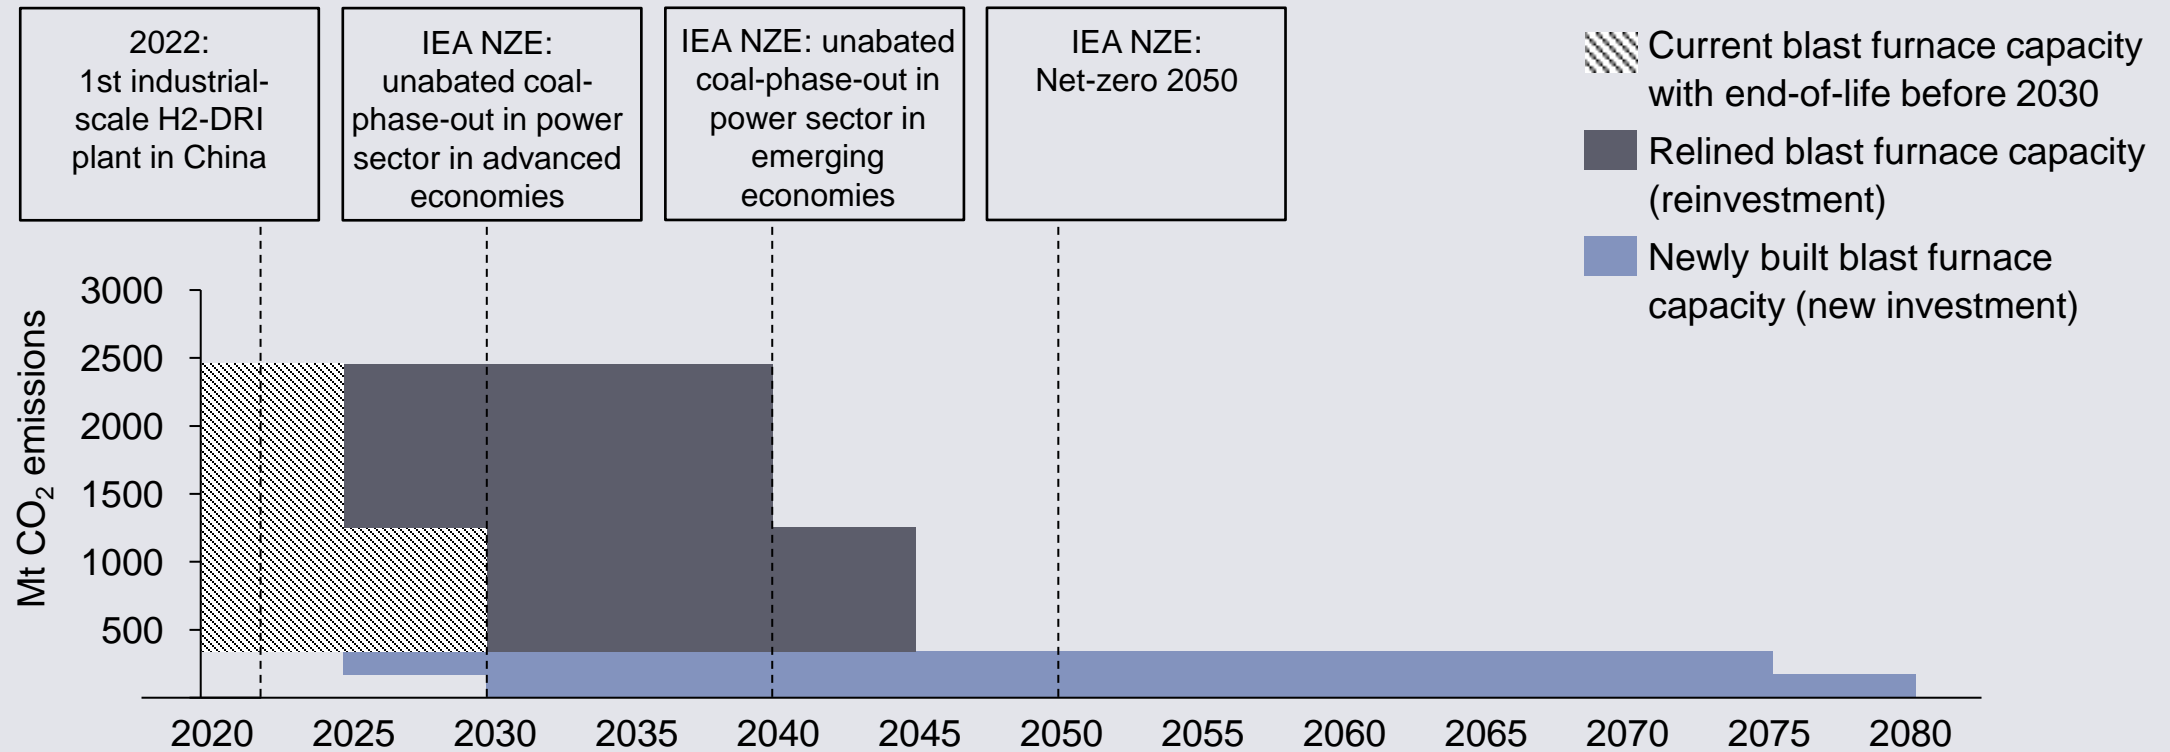

Technical lifetime of coal-based primary steel production capacity and timeframe to achieve Net-Zero 2050

Agora Industry, 2021 * South Korea and South Africa have announced carbon neutrality targets. The targets of Australia, Russia and Turkey are not official yet. All others have announced net zero targets. **n/a; no target *** 15 years lifetime in advanced economies; 20 years lifetime in emerging economies

If all reinvestments and new steelmaking capacity needs are met with coal-based technology, this will create long-term carbon lock-in, lead to stranded assets and endanger jobs

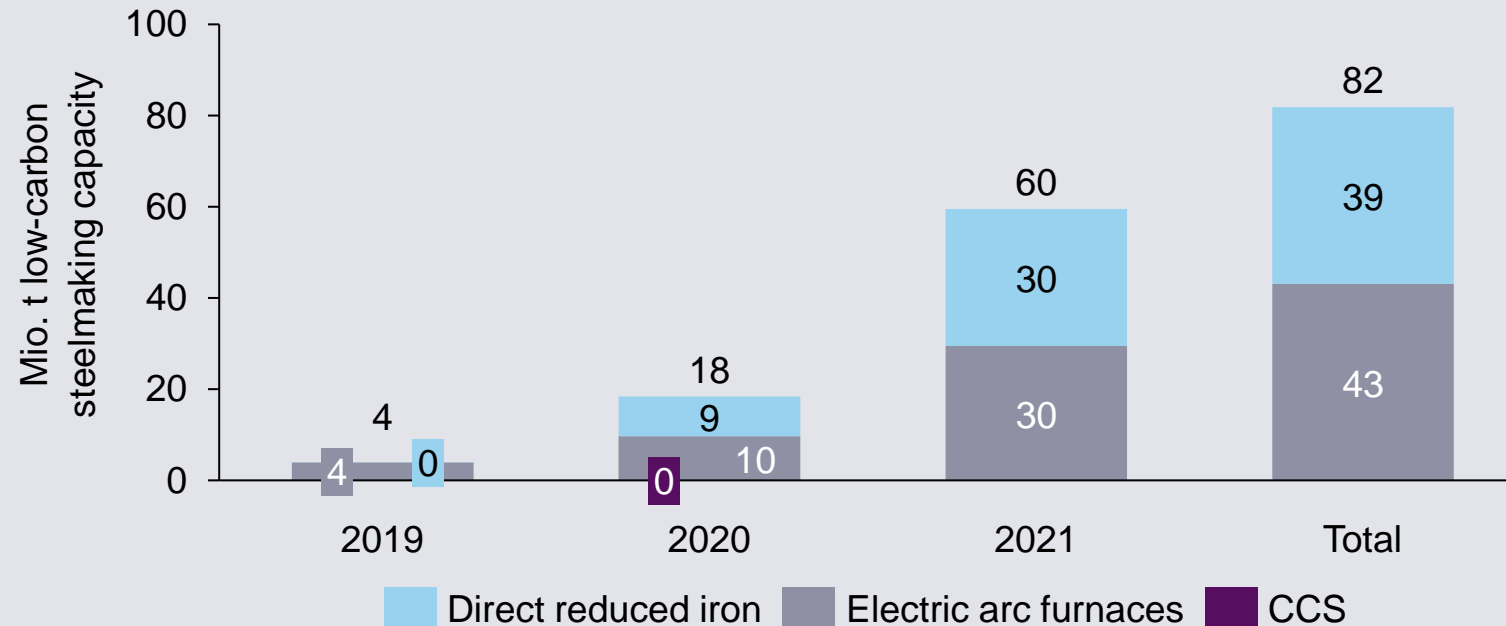

Continued investment in coal-based blast furnaces produces a carbon lock-in

Agora Industry, 2021

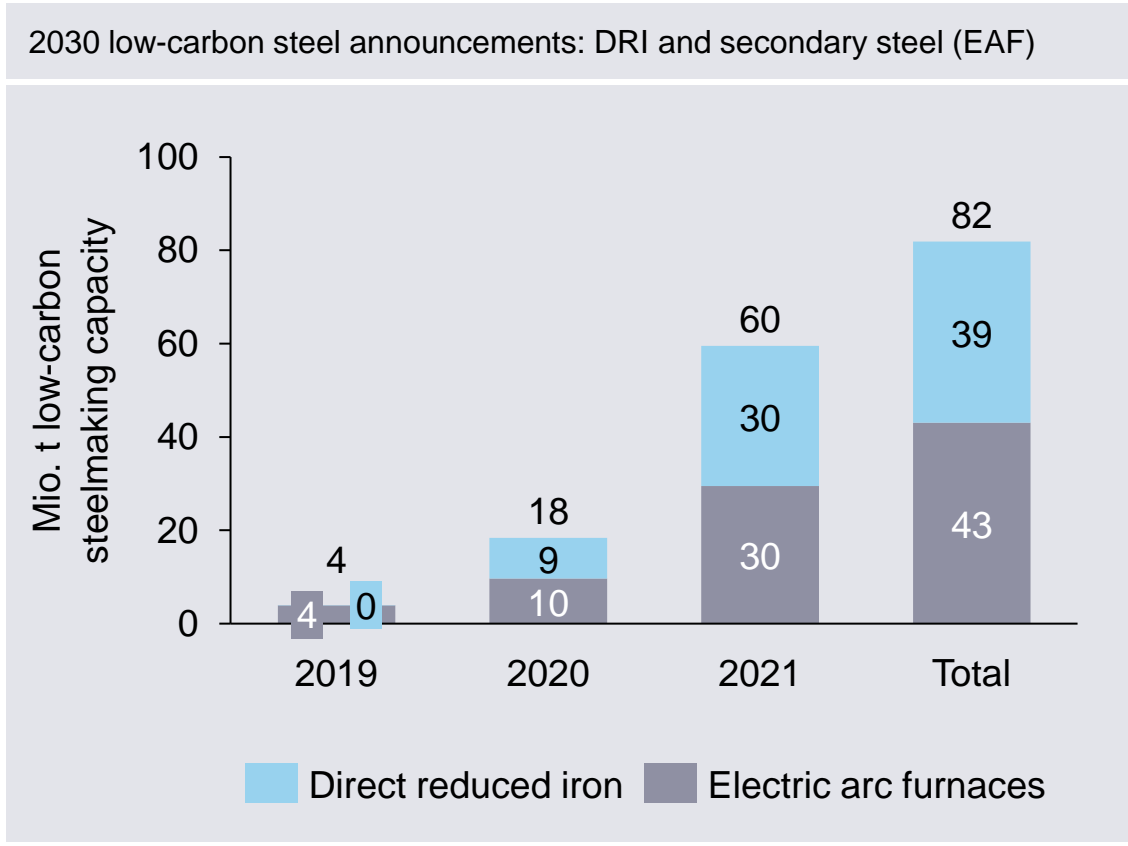

Low-carbon steelmaking technologies are ready to be deployed now – and the project pipeline of announcements to build them before 2030 is growing rapidly

Global low-carbon steel announcements to be built before 2030

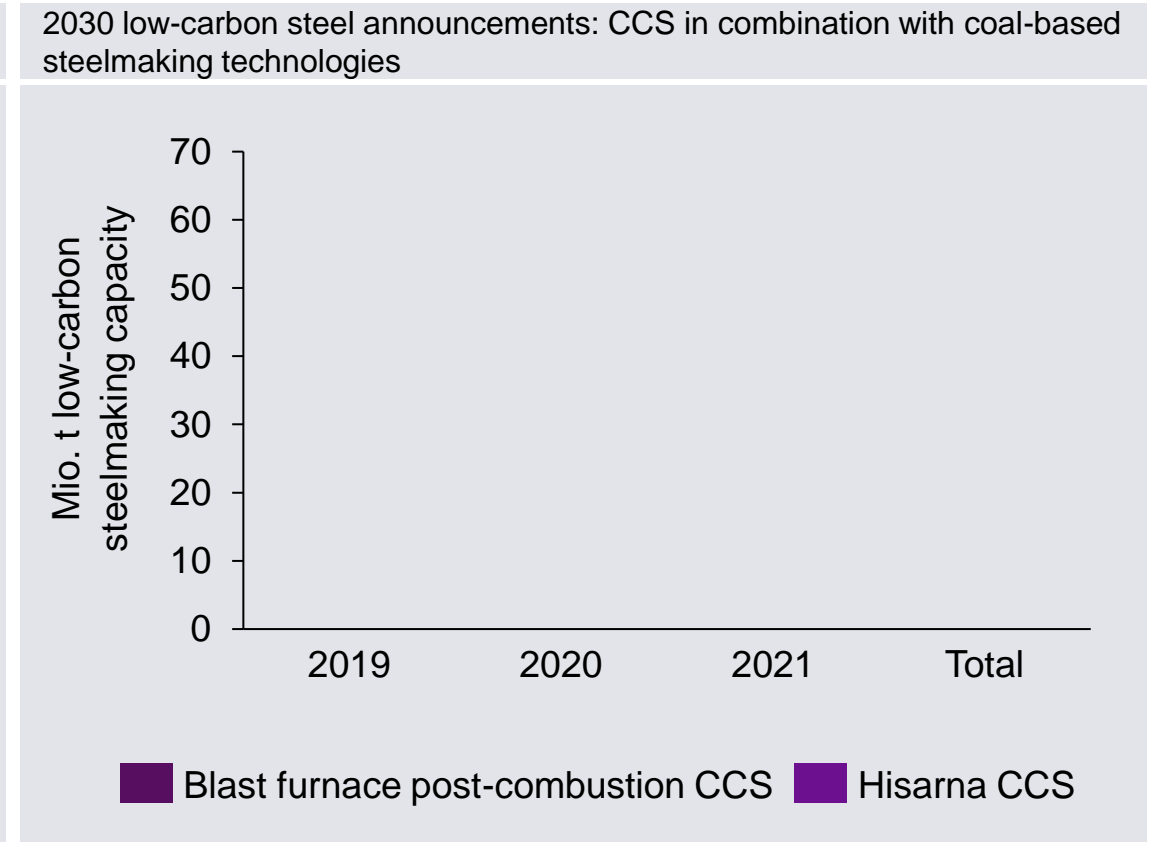

Agora Industry based on Agora Industry Global Steel Transformation Tracker, 2021

The retroactive retrofit of coal-based steelmaking capacities with CCS after 2030 may be a dead-end road – no steel company is working on an industrial-scale project...

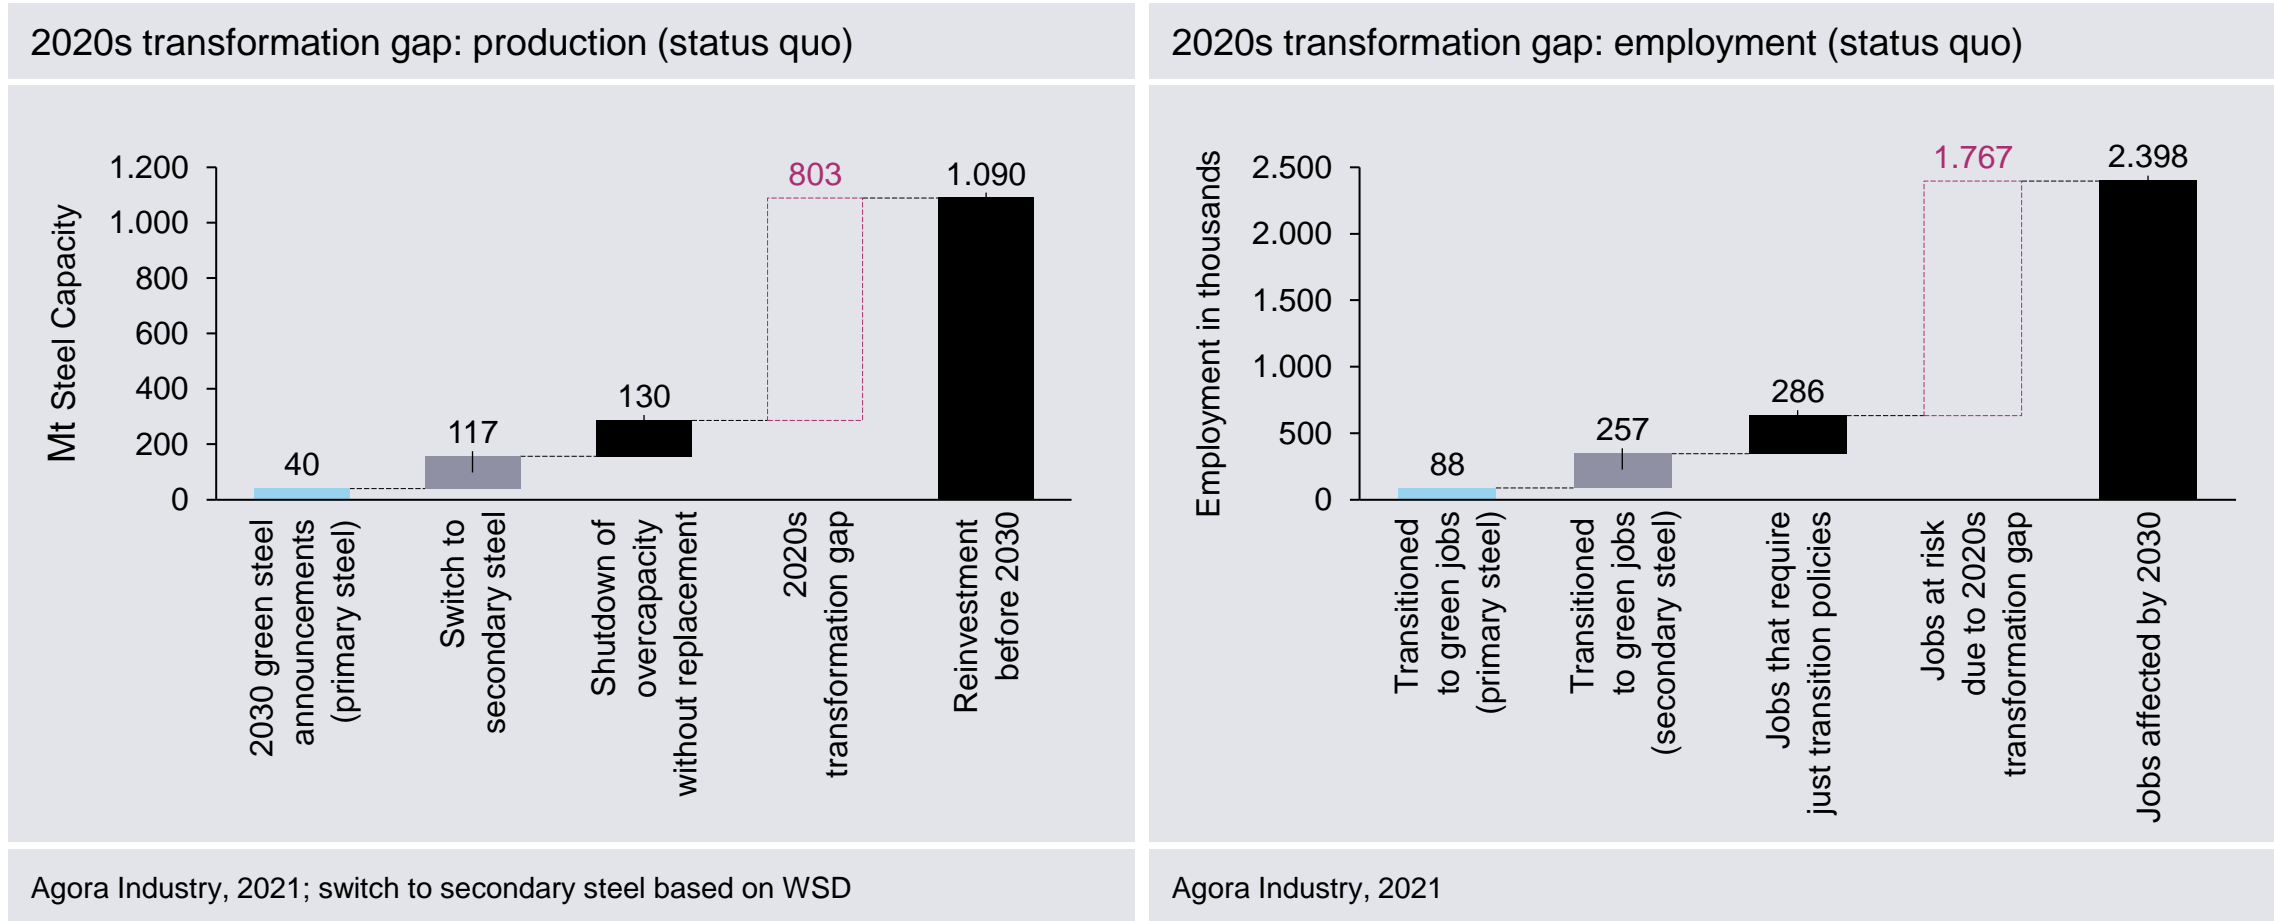

Agora Industry, 2021

Agora Industry, 2021

Therefore, the 2020s need to put the asset transition from coal to clean at its core – each low-carbon steel plant will transition thousands of jobs from coal-based to green, future-proof jobs

Conclusions

- The global steel transformation needs to start in the 2020s. Key low-carbon technologies are ready and can be deployed now.
- Aligning the steel sector with a 1.5°C compatible scenario needs to put the asset transition from coal to clean at its core. The best strategy is to avoid reinvestments into new blast furnaces by instead prolonging lifetimes of old assets by 2-5 years and after 2025, invest into DRI directly.
- By 2030, the global steel sector would require 390 Mt of DRI capacity and 278 Mt of additional secondary steel capacity. This is feasible – and would save the atmosphere 1.3 GtCO₂ per year.
- For advanced economies this means that each blast furnace that reaches the end of its lifetime will be replaced with a technology that is compatible with climate neutrality.
- Emerging economies with rapidly rising steel demand such as India and Southeast Asia should consider a technology leapfrog into new technologies that are compatible with climate neutrality.
- A single-speed global steel transformation can bring enhanced international cooperation and a level playing field. The transformation will help to transition millions of workers to clean, future-proof jobs.

Upcoming: „Global Steel at a Crossroads“ Paper and the „Global Steel Transformation Tracker“

The background of the slide is a collage of images related to pipes and industrial materials. On the left, there are stacks of pipes in various colors (white, blue, green). On the right, there are close-up views of pipe ends, some showing a grid of small circular holes, and others showing larger pipe diameters. The overall aesthetic is industrial and technical.
